Projects conducted to date

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Systematic review of flares definitions used (update of 2005 review)
- Validation study on "escalation of treatment" as a possible flare definition (experience from two clinical studies)
- Validation study on "well-controlled weeks" as a possible outcome for capturing long-term control

What do we mean by long-term control?

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Seems obvious…….but what do we mean and how should we measure it?
- Is this really a separate domain, or repeated measurement of other core outcomes?
- Flares, escalation of treatment, well-controlled weeks, accessing of health resources?
- Can we learn from other chronic disease (e.g. asthma)?

Asthma composite measures of control

TABLE VI. Summary of the characteristics of asthma control score instruments

Instrument	No. of questions	Recall window	Questionnaire content						Physiologic measures
			Symptom frequency	Rescue therapy use	Sleep interference	Activity limitation	Exacerbations	Other	
ACCI	5	1 week (2 weeks for sleep)	X	X	X	X	X		
ACQ	6	1 week	X	X	X	X			FEV_1
ACSS	8	1 week	X	X	X	X			PEF or FEV_1, sputum eosinophilia
ACT	5	4 weeks	X	X	X	X		Self-rating of control	
ATAQ	4 (control dimension)	4 weeks		X	X	X		Self-rating of control	
Breathmobile	7	4 weeks (3 items); 2 years (2 items); no specific window (2 items)	X	X	X	X	X		
cACT	7	4 weeks	X		X	X		Self-rating of control	
CAN	9	4 weeks	X		X	X	X		
30-Second	5	1 week (3 items); 3 months (2 items)	X	X	X	X			

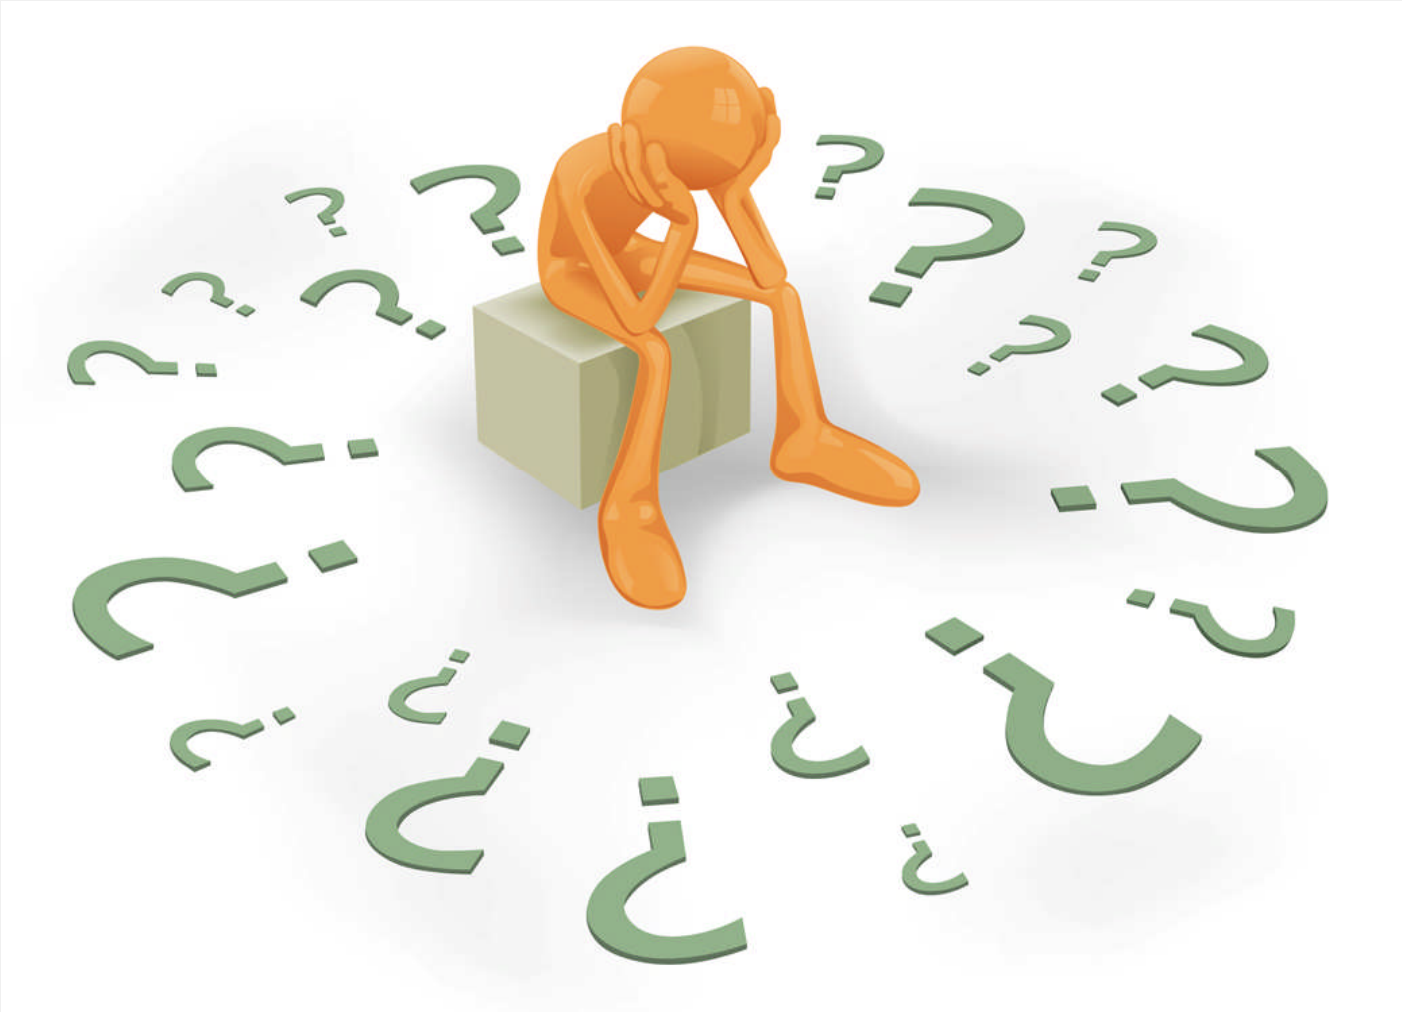
Asthma - exacerbations

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

"The working group participants propose that the definition of ''asthma exacerbation'' be ''a worsening of asthma requiring the use of systemic corticosteroids to prevent a serious outcome.''

- Fuhlbrigge A Asthma outcomes: Exacerbations 2012 *J Allergy Clin Immunol* 2012;129:S34-48.

What do we mean by long-term control?



Group responses

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Need to intervene with a treatment
- Escalation of treatment (what treatment)
- Duration of trial – needs to suit all
- Serial measurement of signs, symptoms and QoL
- Need to reflect that eczema is a chronic disease
  - Capture periodicity OR a serial measurement of the 3 domains
  - Number of bad days / clusters of bad days
  - Avoid term average

Progress to date

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

A. Systematic review of flares definitions

B. Validation study - “escalation of treatment” as a flare definition

C. Validation study - “well-controlled weeks” as an outcome for capturing long-term control a picture

Systematic review of flares

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

How should atopic dermatitis “flares” be defined? Implications for designing and conducting trials

Systematic review of flares (Lead: Sinéad Langan)

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Update of 2005 review (last search date 12th Feb 2013)
- All prospective clinical studies that included “flare” as an outcome
- Search terms: flare$”; “exacerbation$”; "relaps$”; remission$; worse$ and *recurrence”
- A-priori criteria were defined for assessing flare definitions:
  - Assessed by patients
  - Feasible to collect in all settings
  - Flares assessed at the time symptoms experience

Systematic review of flares - results

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- 26 / 414 studies included flare outcomes
  - 12 from original review (additional data extracted)
  - 14 new studies
- 21 different definitions were used
- Definitions categorised:
  - Behavioural definitions (n = 6)
  - Arbitrary cut-off on a scale (n = 11)
  - Symptom-based scales (n = 1)
  - Composite scales - combination of 2 or more (n = 7)

Results

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Data collection methods used:
  - Unscheduled (emergency visits)
  - Daily diaries
  - Scheduled trial visits

- A-priori criteria for flares:
  - Assessed by patients (4 / 21)
  - Feasible to collect in all settings (0 / 21)
  - Flares assessed at the time symptoms experienced (15 / 21)

- **None fulfilled all THREE criteria**

Conclusion

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- None of the currently used definitions seem fit for purpose
- Collection of flares is resource intensive
- Possible most useful for short-term studies, or studies looking at “prevention” of flares

- Flares (as currently defined) = NOT a good contender as a “core outcome” for HOME long-term control

Validation of flares

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

Validation study of “escalation of treatment” as an indicator of atopic dermatitis flares

Validation of flares (Lead: Kim Thomas)

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Data available from two datasets
  - **Study A:**
    RCT of water softeners for eczema (4 months, n = 336))
  - **Study B:**
    Cohort study of environmental triggers for flares
    (6 months, n = 60)

- Definition of flare proposed in 2005 systematic review:
  - Escalation of therapy due to worsening of disease
  - Escalation therapy defined at baseline on individual basis
  - Required daily diaries (paper and electronic)

AIM – to apply the OMERACT filter

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- FEASIBILITY:
  - How acceptable and easy to use was the concept of “escalation of treatment”?
  - How much missing data?
- TRUTH:
  - What proportion of days did participants experience a “flare”?
  - How well does days in flare correlate with “global bother” scores and use of topical medication?
- VALIDITY:
  - How well does days in flare correlate with other scales?
  - Is it responsive to change?

Feasibility

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Well accepted by patients and investigators
- Patients generally liked being able to “track” the eczema on a daily basis (gave feeling of control)
- Missing data surprisingly low
  - STUDY A: 94% of data points complete
  - STUDY B: 60% of data points complete (longer study and electronic diaries prevented data entry after midnight each day)
- **Problems included**: data burden (patients and data management team), potential confusion if “escalation treatment” changed during the study, confusion over dates

Truth – what is it measuring?

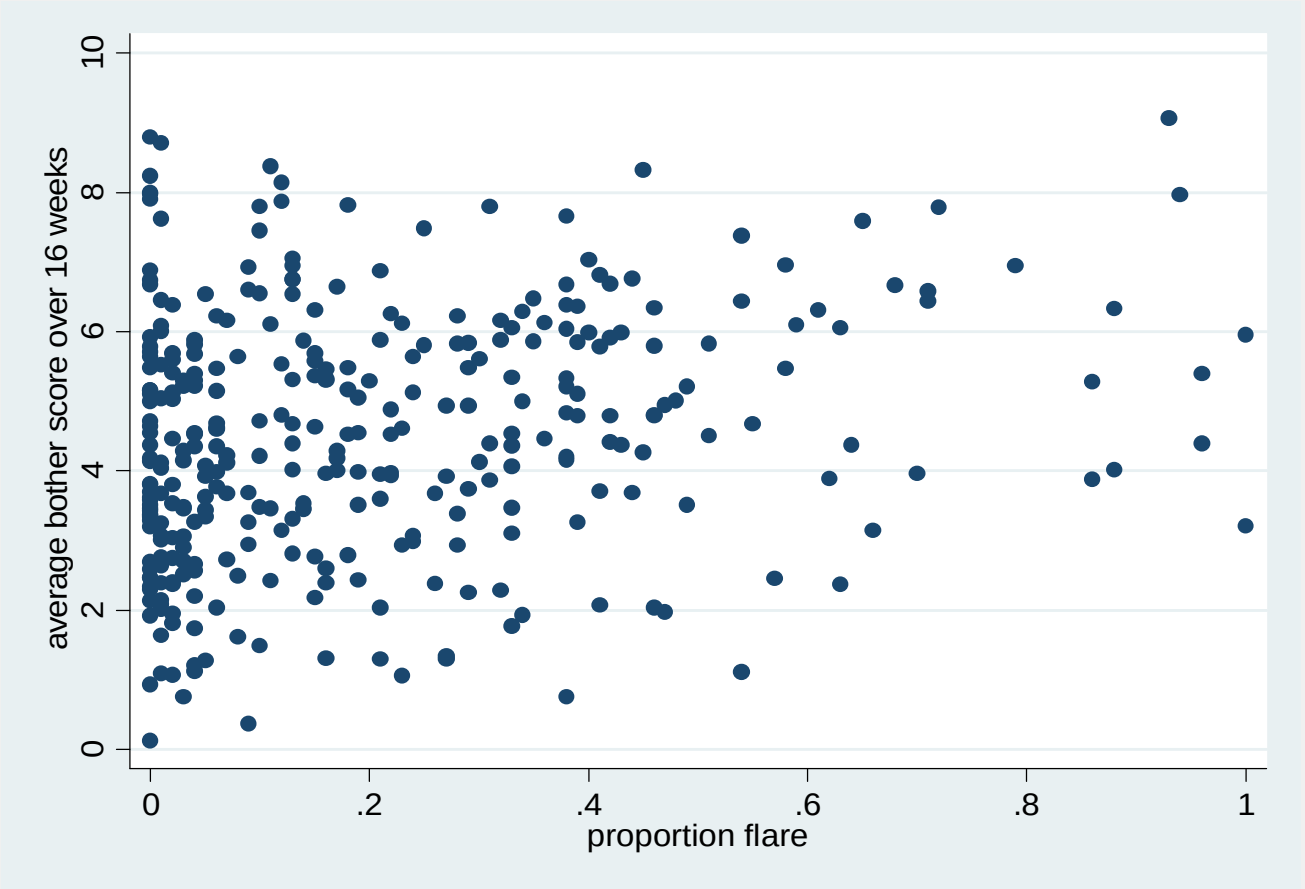
The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

Bother score (0 to 10) 0 = no bother 10 = most bother	Study A Odds ratio (95% CI)	Study B Odds ratio (95% CI)
0	0.007 (0.004, 0.01)	0.08 (0.06, 0.11)
1	0.04 (0.03, 0.05)	0.15 (0.11, 0.21)
2	0.19 (0.16, 0.23)	0.27 (0.21, 0.35)
3	0.42 (0.37, 0.49)	0.63 (0.50, 0.80)
4	1.00	1.00
5	2.16 (1.90, 2.45)	1.43 (1.11, 1.84)
6	4.06 (3.55, 4.65)	2.73 (2.05, 3.65)
7	7.78 (6.70, 9.03)	4.21 (3.08, 5.76)
8	13.24 (11.21, 15.64)	6.43 (4.43, 9.35)
9	19.36 (15.67, 23.92)	6.91 (4.41, 10.81)
10	34.18 (25.54, 45.73)	7.34 (4.69, 11.49)

Correlation of mean bother with % of days in flare

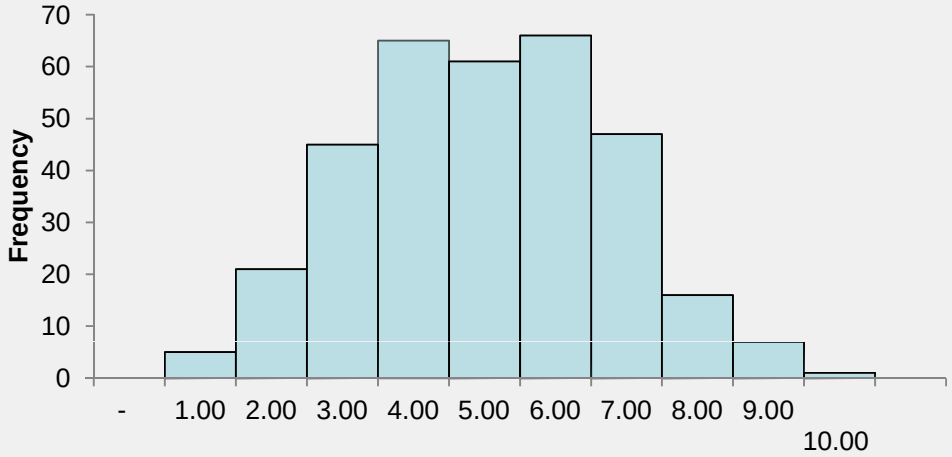
The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

r = 0.23

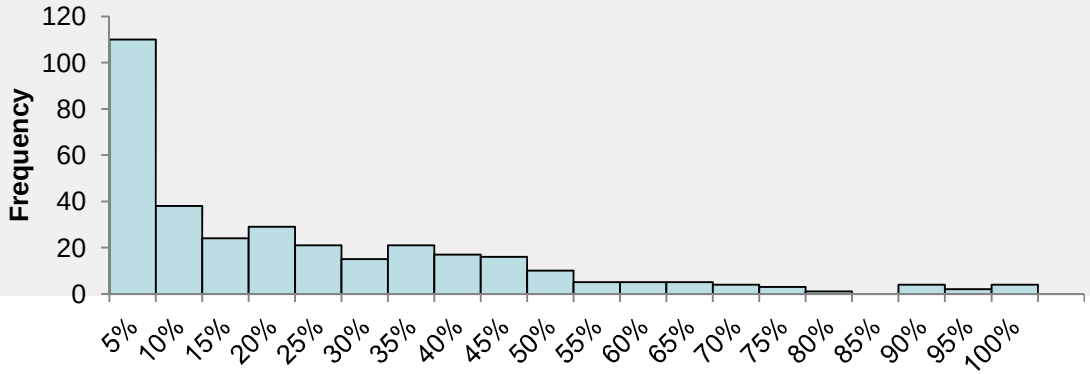


Interpretability, floor & ceiling effects

Average bother score over 16 weeks (Study A)



Proportion of the 16 week period spent in flare (Study A)



Validity – construct validity

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

	Study A * Flares (95% CI) n=331	Correlation	Study B * Flares(95% CI) n=59	Correlation
POEM	0.51 (0.33, 0.69); p<0.001	0.527	0.63 (0.10, 1.16); p=0.021	0.609
TIS	0.04 (-0.01,0.09); p=0.138	0.551	0.08 (-0.07, 0.22); p=0.321	0.61
SASSAD	0.43 (0.14, 0.71); p=0.004	0.762	N/A	N/A

* Increase in outcome measure for one unit increase in number of days in the previous week that treatment was stepped up. Uses data from weeks 4, 12 and 16.

Conclusion

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- This flare definition appears to have face validity and is acceptable to patients, despite relatively high burden in longer term studies
- Flare outcomes correlate moderately well with eczema severity scales POEM, TIS and SASSAD
- Large floor effect seen - even in a population with moderate to severe eczema
- Could be useful in some circumstances, but probably NOT a good option for HOME core outcome

Validation of well-controlled weeks

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

Validation study of “well controlled weeks” as a measure of long-term disease control in atopic dermatitis

Validation of well-controlled weeks

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Well-controlled weeks – a concept “borrowed” from asthma research

- Same datasets as previous study
- Requires daily dairy data

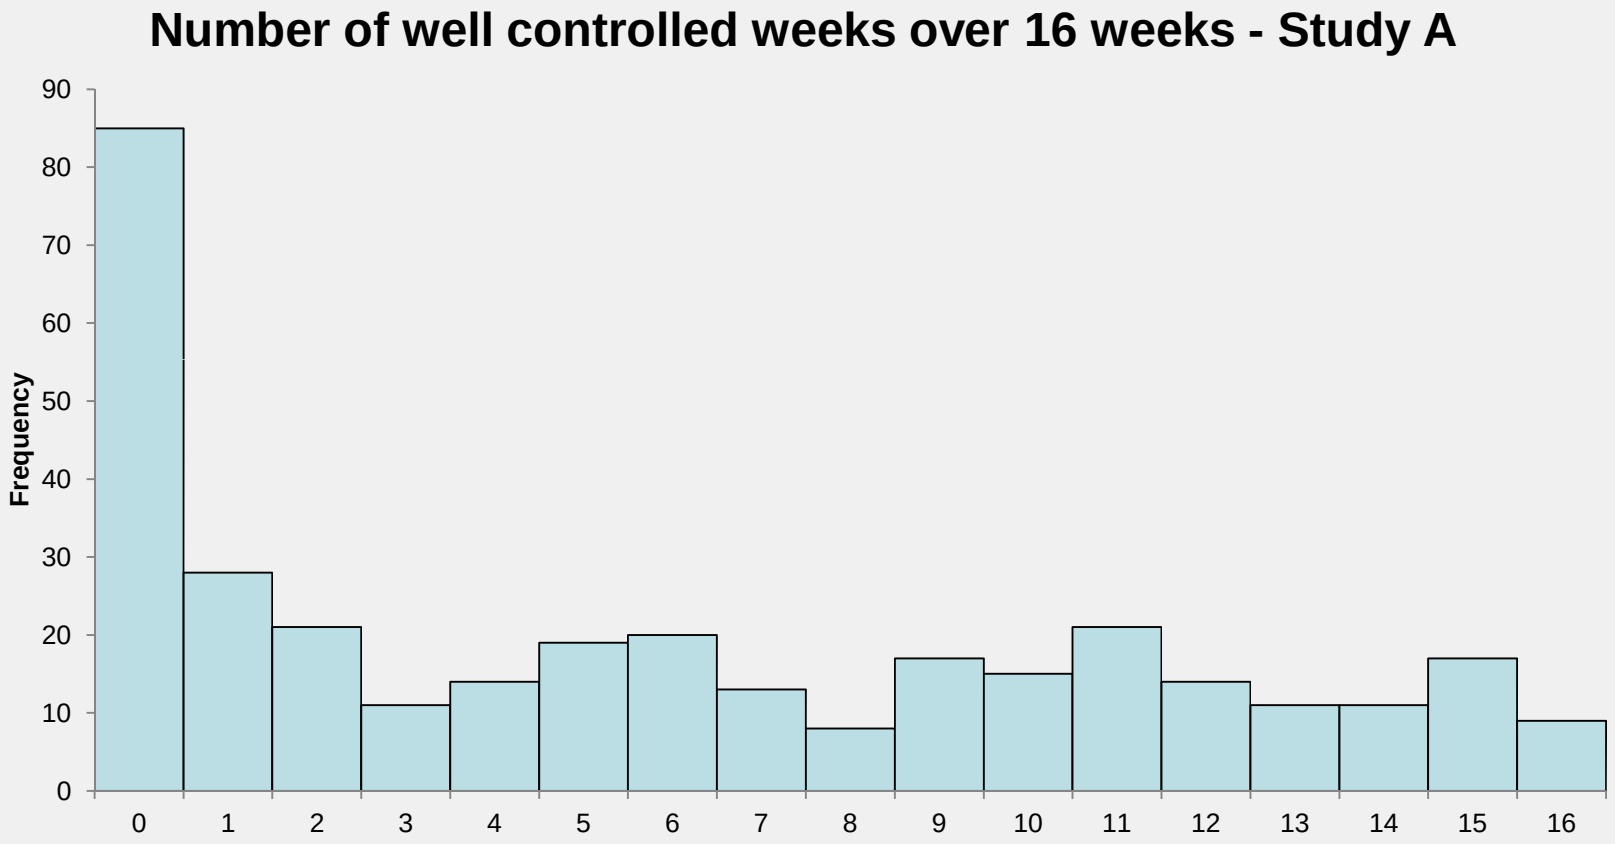
- Well-controlled week defined as:

Treatment “escalated" for ≤ 2 days

plus

≤ 2 days with bother score>4

Interpretability – floor effects



Severity scores by well controlled weeks

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

	STUDY A score for those with a well controlled week compared to not well controlled (95% CI)	STUDY B score for those with a well controlled week compared to not well controlled (95% CI)
POEM	-4.28 (-5.08, -3.48)	-5.26 (-7.24, -3.28)
TIS	-0.49 (-0.72, -0.27)	-0.98 (-1.53, -0.43)
SASSAD	-4.34 (-5.61, -3.07)	N/A

Construct validity

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

POEM scores	STUDY A (95% CI)	STUDY B (95% CI)
Mild (POEM 0 - 7)	5.78 (3.46, 9.67)	7.46 (2.06, 26.93)
Moderate (POEM 8 - 16)	1.00	1.00
Severe (POEM 17 - 28)	0.30 (0.17, 0.52)	0.44 (0.07, 2.79)

Conclusion

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Concept intuitively understood (number of weeks when eczema controlled)
- Significant relationship with validated severity scales, but “floor effect”
- Reliant on complex data collection and data manipulation (combination of symptoms & escalation of treatment)
- Not suitable for all trials, so NOT likely to be a good option for HOME core outcome

Take home messages

- Capturing disease control in “real time” is challenging
- Intensive data collection may be suitable for some trials (particularly if short-term)
- “Well-controlled weeks” and “flares” seem to be intuitively useful concepts, but how to measure them is unclear

Future Direction

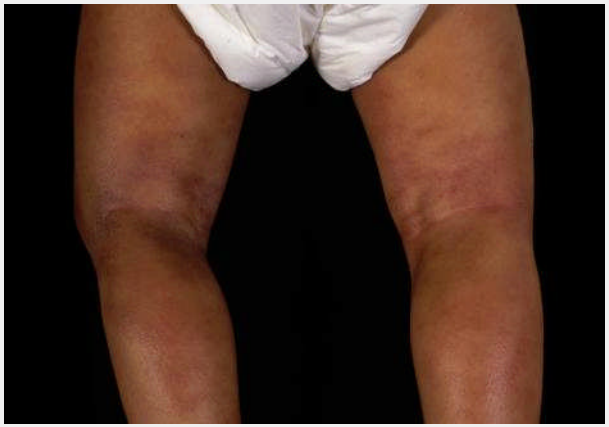
The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- Follow HOME roadmap
  - Systematic review of "long-term control" not just flares
  - Systematic review of validation studies (if there are any)
- Consensus over whether this is a "new domain" or serial measurement of other core outcomes

Group discussions

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

- What needs to be done to progress this work stream?
- Can we reach consensus over what we are trying to capture?
- Start to plan methods for necessary systematic review (identify lead and co-authors)



Disclaimer

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

The HOME initiative is partially supported through an independent research programme funded by the National Institute for Health Research (NIHR) under its Programme Grants for Applied Research funding scheme (RP-PG-0407-10177).

In particular, this grant has supported administration of the HOME project and patient representation at this HOME III meeting.

Truth – what is it measuring?

The University of Nottingham
UNITED KINGDOM · CHINA · MALAYSIA

Change in Bother score	Study A Odds ratio (95% CI)	Study B Odds ratio (95% CI)
No change or improved	1.00	1.00
1	2.01 (1.85, 2.18)	1.87(1.45, 2.41)
2 or more	3.92 (3.47, 4.43)	3.17 (2.50, 4.03)

Bother assessed on a scale from 0 (no bother) to 10 (most bother you can imagine)
